

Building a solution for active monitoring of the Swedish Internet.

RIPE 51, Amsterdam

Rickard Dahlstrand

rd@tilde.se

Background

- The Demeter concept was build for distributed measurement of availability, performance, services and infrastructure.
- 4 large installations running at Södersjukhuset, Sveriges Radio, Nic-se and Sitic (PTS). All these had specific need for distributed measurement.
- They are running measurements for TCP bandwidth, UDP jitter, ICMP RTT, service availability (DNS) and more..

Timeline

- 2003- A distributed dns-monitoring system at Nic-se.
- 2004- 2 installations of a distributed bandwidth-measurement system at Södersjukhuset and Sveriges Radio.
- 2004- Generic Internet service testing platform launched for distributed monitoring of websites, mail-servers etc. (0 customer)
- 2005- Sitic phase 0 was launched, using the setup from the Internet-service.
- 2005- Sitic phase 1 in planning-stage.

The Sitic-project

What is Sitic's interest in this project?

- Everyone shall have access to a broad range of communications services.
- The services shall be easy to use, affordable and of good quality.
- The consumer shall have access to clear information about rights and obligations.
- The consumer shall be well informed in order to easily be able to choose among various services and various service suppliers.
- Sweden shall have a robust infrastructure for communications services and an active exchange of information in IT security issues.

Context

- Well, we are all living in Sweden. So the scope is quite local. =)
- Telia (Skanova) is the big player for broadband access due to its previously tax-funded copper-infrastructure (DSL).
- Government has funded communal fiber-infrastructure. DSL is however still used in many cases for the “last mile”.
- “Fiber to the home” is only available in large cities.

Internet Monitor - Phase 0

- Proof of concept!
- 9 measurement points at different Swedish internet-operators
- Low/no-cost internet connections are used (eq. to friends and family)
- Each point is pinging each other measurement point once every minute and reports back to a central server
- Sitic rented the system, Tilde runs it.
- Launched Mars 2005
- EOL Nov 2005

Goals for phase 0

- Does this type of measurement system work as a concept?
- Can we draw any conclusions from these tests?
- How is peering and transit affecting availability?
- Are there availability problems between operators?

The system

DISCLAIMER! These measurements does not represent any real operator availability!

SITIC - Sveriges IT-incidentcentrum - Microsoft Internet Explorer

Kaspersky antivirusbibliotek är sårbart för en "heap"-baserad buffertöverflödesattack som vid effektivt utnyttjande kan leda till total kontroll över det sårbara systemet.

2005-09-27

SR05-116 RealPlayer och Helix Player - formatsträngsbug

RealNetworks RealPlayer och Helix player för UNIX/Linux är sårbara för en formatsträngsbug. Detta kan leda till att kod exekveras som den användare som kör den sårbara applikationen.

Internet

Measurement collection

Each minute a script is run at the measurement point.

1. The scripts start by sleeping a pre-defined number of seconds according to which probe is running on. (To allow for measurements to be done without affecting each other.)
2. The script connect to the server using https and gets a list of IP's to measure to. (Most ip's are dynamic)
3. 5 ICMP-messages are sent to each IP and RTT max,min,avg and stddev are collected.
4. All measurement-data is sent back to the server using https and added to the database.

Client connectivity problems

- Crashing (ADLS/Cable)-modems
- “last mile” infrastructure problems (ADLS/cable mainly)
- Unscheduled maintenance (There are no scheduled!)
- Power outages
- Portal login-problems
- DHCP-problems
- Problems in the operators distribution-infrastructure
- Operator buy-out (Infrastructure moved to new core-infrastructure)
- Vacuum-cleaners that need the power outlet. =)

Routing problems between operators

- Problems with peering and transit.
- Discovered when a measurement point has contact with some operators, but not others.
- These problems is most likely affecting a larger number of users.

Done Internet

RTT/Jitter measurements

- Especially interesting for VoIP applications.
- Not a good idea for connections in use.
- Roundtrip times for what? ICMP, UDP, TCP??
- Tools, kernels and drivers?

Good RTT

(Check the scale! 60 ms)

Bumb, downtime & peak

(Check the scale! 600 ms)

Bad RTT

(Check the scale! 700 ms)

No problems with

- Operators with fiber infrastructure (~100% availability)
- Measurement point hardware (Really!)
- Server
- Scripts
- Vacuum cleaners!! (REALLY!)

Done Internet

More crazy ideas

- RTT for other protocols? (UDP, TCP RTT)
- Hop-counts?
- Traceroutes? (Is this still a valid tool)

The neat stuff

Hardware

- PC Engines 6" WRAP system boards and boxes
- CPU: 266 MHz AMD Geode SC1100 CPU (x86)
- DRAM: 128 MB SDRAM
- Storage: 128 MB Compact Flash (Industrial grade are recommended!)
- OS: Any x86 OS are supported. (OpenBSD preferred)
- Power: 3-5W at 12 DC.
- LAN: 3 10/100 Ethernet port (National DP83816)
- Watchdog, LM77 temp monitor, serial console and 3 Leds you can flash and flicker!
- No keyboards, vga-ports, usb or power buttons!

</

Ramdisk-kernels

- Primary used for cd and floppy-based OS-installation, but perfect for flash-disk based systems!
- Limits the number of writes and reads to the flash which means longer lifespan and less corrupted flash.
- One kernel-file contains the kernel and a ramdisk image containing the full distribution.
- Means that an entire distribution can be upgraded at once. If you replace one file on flash you replace not only the kernel, but the entire installation.

OS

- Based on OpenBSD 3.7.
- No patches, just a custom built process.
- Follows releases (distribution and kernel)
- Uses PF as a firewall.
- DHCP and NAT on internal interfaces for use as a firewall.
- NTP for timesyncing
- Ram based round robin Syslog + centralized logging.
- OpenBSD rocks!

Remote Management using SSH

- It's secure and can be scripted!
- All measurement points respond with SSH on a non-standard port
- Only public-key authentication allowed (a master key)
- Using `ssh` & `scp` you can basically do anything!
- Including OS-upgrades!

To check the temperature

```
[rd@demeterupdate]# execall "sysctl hw.sensors"
-----Probe1-----
hw.sensors.0=lmtemp0, TEMP, temp, 38.50 degC / 101.30 degF
-----Probe2-----
hw.sensors.0=lmtemp0, TEMP, temp, 37.00 degC / 98.60 degF
-----Probe3-----
hw.sensors.0=lmtemp0, TEMP, temp, 45.50 degC / 113.90 degF
-----Probe4-----
hw.sensors.0=lmtemp0, TEMP, temp, 37.00 degC / 98.60 degF
-----Probe5-----
hw.sensors.0=lmtemp0, TEMP, temp, 39.00 degC / 102.20 degF
-----Probe6-----
hw.sensors.0=lmtemp0, TEMP, temp, 44.00 degC / 111.20 degF
-----Probe7-----
hw.sensors.0=lmtemp0, TEMP, temp, 40.50 degC / 104.90 degF
-----Probe8-----
hw.sensors.0=lmtemp0, TEMP, temp, 39.50 degC / 103.10 degF
-----Probe9-----
hw.sensors.0=lmtemp0, TEMP, temp, 39.00 degC / 102.20 degF
[rd@demeterupdate]#
```

To verify NTP-functionality

```
[rd@demeterupdate]# execall date
-----Probe1-----
Tue Oct 11 14:09:54 CEST 2005
-----Probe2-----
Tue Oct 11 14:09:55 CEST 2005
-----Probe3-----
Tue Oct 11 14:09:56 CEST 2005
-----Probe4-----
Tue Oct 11 14:09:57 CEST 2005
-----Probe5-----
Tue Oct 11 14:09:59 CEST 2005
-----Probe6-----
Tue Oct 11 14:10:01 CEST 2005
-----Probe7-----
Tue Oct 11 14:10:02 CEST 2005
-----Probe8-----
Tue Oct 11 14:10:03 CEST 2005
-----Probe9-----
Tue Oct 11 14:10:04 CEST 2005
[rd@demeterupdate]#
```

Or to upgrade

```
[rd@demeterupdate]# upgradeall bsd37.kernel
-----Probe1-----
bsd moved to obsd, new bsd moved to flash, rebooted
-----Probe2-----
bsd moved to obsd, new bsd moved to flash, rebooted
-----Probe3-----
bsd moved to obsd, new bsd moved to flash, rebooted
-----Probe4-----
bsd moved to obsd, new bsd moved to flash, rebooted
-----Probe5-----
bsd moved to obsd, new bsd moved to flash, rebooted
-----Probe6-----
bsd moved to obsd, new bsd moved to flash, rebooted
-----Probe7-----
bsd moved to obsd, new bsd moved to flash, rebooted
-----Probe8-----
bsd moved to obsd, new bsd moved to flash, rebooted
-----Probe9-----
bsd moved to obsd, new bsd moved to flash, rebooted
[rd@demeterupdate]#
```

For those who don't like SSH

- A webbased management and troubleshooting interface accessible over https.
- Contains logs, ifconfig, netstat, firewall-config etc.
- Open on local ethernet ports and via Internet using a shell debugcommand:

```
[root@probe3 root]# openhttps
External management interface open from 193.0.9.111, now goto https://xxx.xxx.xxx.xxx/
[root@probe3 root]# closehttps
External management interface closed!
[root@probe3 root]#
```

Conclusion

Is it any good?

- Well, not really. It doesn't really answer any questions clearly!
- And you can't really draw any conclusions what caused a problem and where the problem was located.
- 9 measurement points really doesn't represent the Swedish Internet very well.
- People in Sweden need resources from other parts of the world as well.
- However, it will never give you a false positive!
If a connection is up, it's working!

Problems

- Multi-operator infrastructure. (Where network owners and service providers are separated)
- Not enough measurement points.
- Measurement are made from consumer connections.
- Measurements are only made from Swedish parts of the Internet.

Who needs this?

- Consumers
 - Is a problem with my operator or my connection?
 - How is traffic working between my office and my home-connection?
 - Which operators/connection is the best?
- PTS
 - How is the Swedish part of Internet working?
- Operators (they just don't know it yet)
 - Check how well their peering and transit is actually working
